Integrated Payment Solutions
for Embedded Point of Sale

▶IPTran LT™

Low-cost, Single-Lane Integrated Payments for Point of Sale Applications

The IPTran LT™ is a small-footprint, low-cost IP-based integrated payments device for Point of Sale applications. IPTran LT provides POS applications with the ability to process credit, debit and gift transactions directly to virtually all payment processors in North America via one, simple interface without per-transaction gateway fees.

IPTran LT provides a secure, plug and play integrated payments option for embedded Point of Sale applications. Because IPTran LT is configured and managed in the cloud, installation, service and support have never been more simple.

Flexible Installation
The ability to easily swap PIN Pads and MSRs creates an unparalleled level of installation flexibilty and mobility between payment processors - Change encryption methods and EMV-supported pads based on the specific requirements of each customer!

Out-of-Scope Payments
Because Datacap drives a variety of PIN Pads and MSRs directly via IPTran LT, no cardholder data comes into contact with the POS application, resulting in an Out-of-Scope solution - No PA-DSS validation necessary if IPTran LT is driving the 'card-entry device'.

Cloud-Based Management
Applications are configured via Datacap's cloud-based product management portal, PSCS™ and then loaded into the IPTran LT via patented AutoLoad™ or NoLoad™ technologies, allowing for simple plug and play implemenation/support.

Solutions as a Service - Recurring Revenue
Authorized Datacap resellers can take advantage of SaaS programs offered by a variety of top-tier payment processors that provide Datacap products at no cost and pay ongoing residuals for the life of the account.

Features and Benefits

Access to all Payment Processors
IPTran LT supports virtually all payment processors in North America via a single interface at the Point of Sale. No need for direct integrations or certifications to individual processors - no per transaction fees from third-party gateways!

Peripheral Management
IPTran LT drives a variety of widely used PIN Pads and MSRs that allows for unparalleled installation flexibility - Switch between payment processors or add encrypted devices simply by updating the Tran via the cloud and install a compatible plug and play peripheral.

Out-of-Scope Integration (PA-DSS)
Because no card holder data comes into contact with the POS application when utilizing Datacap's OOS interface, the POS is considered to be "payment unaware" and therefore not subject to PA-DSS. Encryption and tokenization options provide an additional layer of security for IPTran LT users.

Solution-as-a-Service Options
POS Integration partners can offer IPTran LT as part of a SaaS program from a variety of channel-friendly payment processors - No upfront investment! Or, offer your own SaaS program and rent the units from Datacap directly at a fixed monthly fee. Support for remote lock-down is unique to IPTran LT and ideal for pay-as-you-go POS.

Cloud-Based Product Management
IPTran LT connects directly with the payment processors (no third party gateway necessary), but is still configured, purchased, and updated in the cloud. Simply log-on to Datacap's PSCS™ (Payment Systems Config Server) to manage your new and existing customers 24/7.

Integrate All forms of Point of Sale
Datacap's open product architecture, DatacapConnect™, allows POS providers to consolidate payments from all forms of POS - mPOS, mobile extensions, PC-based POS, cash registers, kiosks, vending machines, etc., creating an extremely customizable solution that can accommodate the needs of any merchant
